

PSP-STD-002

Peach Suite Pro UI Standards

Version 1.0 Draft | Peach Suite Pro | Internal Standard

Document Number	PSP-STD-002
Status	Draft
Owner	Master Admin
Release Policy	Tuesday Night Releases

1. Purpose

This standard defines the visual and interaction rules used across Peach Suite Pro. The goal is a calm, consistent, desktop application-style experience that helps owners work efficiently without visual noise.

2. Core UI Philosophy

- Information over decoration.
- Consistency over cleverness.
- White space is preferred over crowded layouts.
- Use small, readable fonts and avoid oversized headings.
- Minimal bold text and minimal strong-tag usage.
- The user should feel oriented on every page.
- Every important action should be clear, reversible where possible, and predictable.

3. Neighbor Test

If the neighbor across the street can read the page, the fonts or headings are too large. Peach Suite Pro should feel like a professional desktop application, not a marketing landing page.

4. Standard Page Layout

- Use a modest page title.
- Use one short subtitle or description when helpful.
- Keep primary content aligned and grouped.
- Avoid oversized cards and loud visual containers.
- Use consistent page spacing across modules.
- Prefer tables and detail rows for business information.

5. Standard Action Page Layout

Action pages such as Archive, Delete, Duplicate, Restore, and Complete should follow the same predictable pattern.

- Page title: action plus record type.
- Short explanatory sentence.
- Item Details section.
- Cancel button on the left.
- Primary action button on the right.

- Archive and Delete require confirmation pages.
- Delete language must clearly state permanence.

6. Buttons and Actions

- Use one primary action per page.
- Secondary actions should be visually quieter.
- Destructive actions should use the danger button class if available.
- Actions menus should be consistent: View, Edit, Duplicate, Archive, Delete.
- Archived items should show Restore instead of Archive.
- Avoid placing too many buttons at the top of a page.

7. Archive vs Delete UI

- Archive is reversible and preferred whenever practical.
- Delete is permanent and should be used rarely.
- Archived records should be hidden by default.
- Use a simple Show Archived checkbox when archived records are needed.
- Archived items should show a clear Status value of Archived.

8. Forms

- Labels should be clear and concise.
- Inputs should use consistent widths and spacing.
- Required fields should be obvious but not visually loud.
- Use helper text sparingly.
- Place Save/Cancel actions at the bottom.
- Do not use bold labels unless necessary.

9. Tables and Lists

- Tables should prioritize scannability.
- Use consistent column order across modules.
- Status columns should use text, not color alone.
- Avoid overly tall rows.
- Actions should be grouped in a predictable Actions menu.

10. Color and Emphasis

- Use color sparingly.
- Do not rely on color alone to communicate meaning.
- Avoid bright or loud warning blocks unless the action is critical.
- Use calm, professional colors that match a business application.

11. Terminology

- Use Business instead of Spa where the feature is general.
- Use Client where customer records are stored.

- Use Archive for reversible removal.
- Use Delete only for permanent removal.
- Use Daily Briefing for the owner command center.
- Use Business Coach for AI-assisted recommendations.

12. Revision History

Version 1.0 - Initial draft. Captures current UI direction, Neighbor Test, action page layout, and archive/delete standards.

Checkbox Standard

All inline checkboxes shall use the compact-checkbox CSS class.

Purpose:

Consistent spacing

Consistent alignment

Prevent full-width labels

Desktop application appearance

Example:

```
<div class="compact-checkbox">  
  <input type="checkbox" id="show_archived">  
  
  <label for="show_archived">  
    Show Archived  
  </label>  
</div>
```
